

1. This is the primary combobox. It's named 'cboValdAnL'.

The SQL code below AfterUpdate event is as follows:

```
Me.cboVäljAffM.RowSource = "SELECT tblAffM.AffMID, tblAffM.Projektnamn,
tblProjektort.Projektort, tblStatus.Status, tblAffM.AnbudsledareID" _
& " FROM tblStatus INNER JOIN (tblProjektort INNER JOIN tblAffM ON tblProjektort.[ProjektortID]
= tblAffM.[ProjektortID]) ON tblStatus.StatusID = tblAffM.StatusID" _
& " WHERE (((tblStatus.Status) = 'Open' Or (tblStatus.Status) = 'Not started') And
((tblAffM.LeaderID) = me.cboValdAnL))" _
& " ORDER BY tblAffM.Projektnamn, tblProjektort.Projektort"
```

And then I add:

```
me.cboValdAffM.Requery
```

2. When above code is running, I still get the InputBox. Strange. I've checked that I actually have a value for me.cboValdAnL (and this is a numeric field). It's just that it doesn't seem to interpret the numeric value in cboValdAnL
3. This is the second combobox, which name is cboValdAffM

Can it have something to do with that the form is placed inside a navigation form with both horizontal and vertical tabs?
