

Just out of curiosity:

A form is usually based on, for example, a table or a query. You then enter the name of that table or query on the second tab (in this case "Qry_004_Settings_Admin") and the form will then retrieve the records when opened.

Eigenschappenvenster
Selectietype: Formulier

Formulier

Opmaak	Gegevens	Gebeurtenis	Overige	Alle
Recordbron	Qry_004_Settings_Admin			
Type recordset	Dynaset			
Standaardwaarden ophalen	Ja			
Filter				
Filteren bij laden	Nee			
Sorteren op				

Question:

Is it also possible to NOT enter "Qry_004_Settings_Admin", but to retrieve this via VBA?

Eigenschappenvenster
Selectietype: Formulier

Formulier

Opmaak	Gegevens	Gebeurtenis	Overige	Alle
Recordbron				
Type recordset	Dynaset			
Standaardwaarden ophalen	Ja			
Filter				
Filteren bij laden	Nee			
Sorteren op				

I tried this, but of course it doesn't work ;-)

```
Option Compare Database
Option Explicit

Private Sub Form_Load()

    DoCmd.OpenQuery "Qry_004_Settings_Admin"

End Sub

Private Sub Config_DblClick(Cancel As Integer)
On Error Resume Next

    If Setting = "checkIntegrity" Then
        Call VerifyIntegrity
    End If

End Sub

Private Sub Config_TestForm()
```

Anyone has a suggestion?
